- **1.** Henle 9.14
- **2.** Henle 9.15
- **3.** Show that any pair of parallel lines in hyperbolic geometry are congruent. Recall that parallel (in the text) means something different from "do not intersect".

Due: March 23, 2022

- **4.** Compute the distance between the point i and the line x = 1 in the upper half plane model.
- **5.** Consider a bug moving in the upper half space model along the imaginary axis with position y(t)i and suppose that $y(t) \to \infty$ as $t \to \infty$. Show that the distance between the bug and the line x = 1 goes to zero as $t \to \infty$. That is, you are showing that the lines x = 0 and x = 1 get closer and closer together as $y \to \infty$.
